

SAMPLE PROGRAM

This example program illustrates the problem I am having with the preprocessor 'eqn'. Basic groff seems to work and the macro '-ms' seems to work, but not eqn, either for in-line equations, such as $F = ma$ or for equations set off with .EQ/.EN, such as

$$F = m \text{ sub } j \text{ a sup } k$$

I am using groff v 1.19.2 on a MAC workbook.

I suspect that I might be using the command line incorrectly. I am using groff -ms example.txt > example.ps. I get no error messages with this command. I have tried every permutation of the command that I can think of, all without success. This has included the extension -e in various positions in the command.

I have used troff successfully under unix on a SUN and more recently groff under Linux on a PC. I am new to the MAC.
